Better Protection & Moisturizing

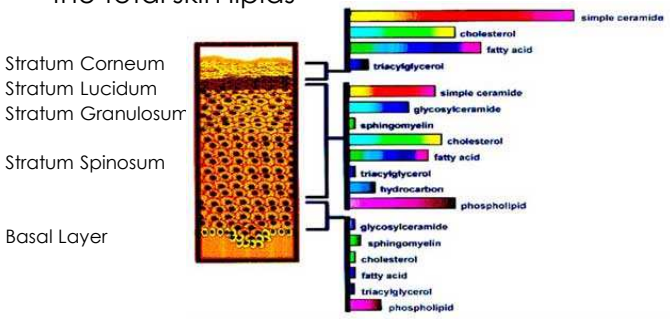

Ceramide Liquid Crystal

*Trade Name : Ceramide LC S-20

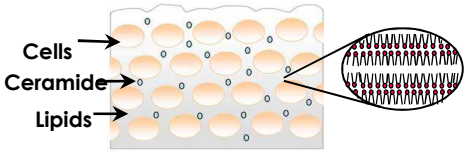

INCI Name : refer to composition

Introduction

- Ceramide is the most important lipids in Stratum Corneum which provides "skin barrier function".
- Ceramide decreases "trans-epidermal water loss" and increases "cohesion of the upper layers of epidermis"
- Ceramide makes up about 40% to 65% of the total skin lipids

- The lipids between Stratum Corneum cells in human body are composed with Ceramide in a multiple liquid crystal structure.
- It is important to have L.C form for the barrier function and in order to prevent water loss

Composition

- **INCI Name**

Propylene Glycol, Hydroxypropyl Bisstearamide MEA, Butylene Glycol, Dipropylene Glycol, Behenyl Alcohol, Ceteareth-20, Cholesteryl Isostearate, Squalane, Tricaprylin, Cholesterol, Cetearyl Alcohol, Stearic acid, Dimethicone and Phenoxy Ethanol

Why Liquid Crystal Form?

1st Easy formulation

- High content of Ceramide (20%)
- Good solubility in water phase
- Ready to formulate

2nd High Quality

- Strong barrier function
- Non-Greasy, lubricating feeling (different from Silicone's)

Specifications

Appearance	Turbid, white to light yellow paste
Odor	Subtle characteristic odor
pH	7.0 ~ 7.5
Melting Point	**50 ~ 55 ℃**
Assay (PC-108)	**19~21%**
Heavy metals	Max. 20 ppm
Arsenic	Max. 2 ppm
Microbial count	<100 cfu/g

Application

- The liquid crystal type easily dissolves in water and remains in "micro liquid crystal structure" after formulated in cosmetic products. It is very stable and, it does not affect the emulsion particles & the liquidity of the products.
